

A TRULY MODULAR  
STRUCTURE

## Revolution - a new concept in temporary structures

The modularity of the structure is given through units of 5m x 5m made of aluminium and a double curved PVC fabric to create an aesthetically pleasing series of peaked roofs, allowing maximum light penetration. Roof blocks are made up on a 20m x 20m grid, thus enabling structures from 5m wide to any width you wish and in any configuration you can conceive.

The frame structure is constructed on the ground, improving safety and allowing ancillary items, such as lighting, to be fitted before erection with cranes or purpose designed masts.

Just 5 different beams and 10 different components in all allow construction of any size you wish. The engineering principles of the roof structure mean that side height is of secondary importance with regard to stability, opening up the possibility of far higher uprights than available with current structures.

We are currently developing a preparatory mezzanine flooring system to create a multi-deck structure.

**Whatever your vision, Arena Structures will bring it to reality.**
